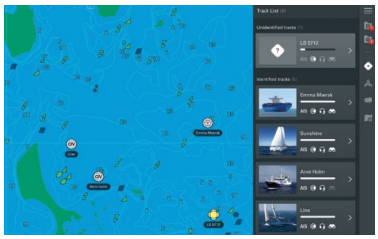
Projects

A selection of some of the projects I have worked on:

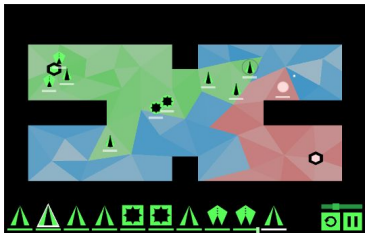
"C-Flex": A Command-and-Control system for Coast Guard and Navy ships. Uses the Luciad engine for 2D rendering. Provides real-time situational awareness and visualization. I have worked as UI/UX specialist, Lead developer, Product Owner and Manager throughout many release cycles.



"The PRINCE2 Game": A project management simulation game. The player is a project manager and must initiate activities and processes, talk to people in the organization, read documents, and make decisions. Built with Unity. I was the lead, and at times only, developer on the team.

"MovieStarPlanet": A social Flash game aimed at tweens. I have worked as both programmer and frontend architect. My work has included performance optimization, a bone animated avatar, client-server communication, porting web to mobile and fixing urgent issues on live production servers.

"Tactygon": An RTS in a minimalist style developed as an indie project lasting one year . As project lead and scrum master on a team of six, I worked on most aspects of development, including design, programming and project management.
Developed in Unity and released for Android and iOS.



"CIMIC Learning Lab": A learning game produced by Interactive Lab Production for the Danish military. It is a 3D first-person game and uses the Unity engine. I have worked on most programming aspects of this project such as gameplay, NPC control, GUI, synchronization, animation and bone control.

"Watchmen: The End is Nigh": A 3D console game released in 2009 by Deadline Games using the Kapow engine..
I worked with broad tasks including artificial intelligence, HUD, input, optimizations and general gameplay features.
